

Community Contributions from the PowerShell Gallery by Download

These are the most popular 250 modules based on total download count for modules published to the [PowerShell Gallery](#). The report filters out corporate authored modules from Microsoft, Amazon, Dell, Oracle, HP, and VMware. DSC modules are also excluded. The intent is to highlight contributions from individual members of the PowerShell community. The newest modules are listed first. Use Import-Module to install them or check the online repository for more information.

[Carbon](#) | 2.12.0

Published: 08/10/2022 16:55:40 by Aaron Jensen

Carbon is a PowerShell module for automating the configuration Windows 7, 8, 2008, and 2012 and automation the installation and configuration of Windows applications, websites, and services. It can configure and manage:

- Local users and groups
- IIS websites, virtual directories, and applications
- File system, registry, and certificate permissions
- Certificates
- Privileges
- Services
- Encryption
- Junctions
- Hosts file
- INI files
- Performance counters
- Shares
- .NET connection strings and app settings
- And much more!

All functions are idempotent: when run multiple times with the same arguments, your system will be in the same state without failing or producing errors.

Pester | 5.3.3

Published: 04/29/2022 09:45:25 by Pester Team

Pester provides a framework for running BDD style Tests to execute and validate PowerShell commands inside of PowerShell and offers a powerful set of Mocking Functions that allow tests to mimic and mock the functionality of any command inside of a piece of PowerShell code being tested. Pester tests can execute any command or script that is accessible to a pester test file. This can include functions, Cmdlets, Modules and scripts. Pester can be run in ad hoc style in a console or it can be integrated into the Build scripts of a Continuous Integration system.

Write-ObjectToSQL | 1.13

Published: 02/11/2017 21:09:56 by John Roos

Writes an object into a database table. If the table does not exist it will be created based on the properties of the object. For every property of the object a column will be created. The data type for each column will be converted from .Net data types into SQL Server data types.

Not all data types are supported. Unsupported data types will be ignored (but can be listed). If several objects are sent through the pipeline only the first object will be used for creating the template for the table.

Make sure that all objects in the pipeline have the exact same properties (this is usually the case). While creating the table the script will also add two default columns. One called 'id' which is a regular auto counter (integer which increases with 1 for every row) and another column called 'inserted_at' which will have a default value of GetDate() which represents the timestamp for when the row was inserted. If a property is named the same as one of these default columns then a 'x' will be added before the name of those columns to avoid duplication. (if propertyname=id, then propertyname=xid, etc.)

Hashtables are handled slightly different. When using hashtables the script will simply use the keys as columns. Keep in mind that properties on the objects are used. Some objects, like strings, might only have a length property but what you really want to insert into the table is the value of the string.

The following command would generate a table with one column called Length which would contain the length of the strings (probably not what you want):

'oink','meo'	Write-ObjectToSQL -Server localhost\sqlexpress -Database MyDB -TableName myTable
--------------	---

The following command is a better way to do it. Instead of piping the strings directly you should create custom objects or, as in this example, hash tables. This will generate a table with a column called 'text' which will contain the values 'oink' and 'meo':

@{'text'='oink'}, @{'text'='meo'}	Write-ObjectToSQL -Server localhost\squlexpress -Database MyDB -TableName myTable
-----------------------------------	--

Another thing to note is that this script will only take Property and NoteProperty into consideration. So for example ScriptProperty and ParameterizedProperty will be ignored. You can verify your objects with the Get-Member cmdlet and check the MemberType.

Currently the script supports the following data types:

Int32 UInt32 Int16 UInt16 Int64 UInt64 long int Decimal Single Double Byte SByte String DateTime TimeSpan
datetime string bool Boolean GUID

[PowerNSX](#) | 3.0.1192

Published: 05/10/2021 01:30:54 by Nick Bradford

PowerNSX is a PowerShell module that abstracts the VMware NSX API to a set of easily used PowerShell functions. This module is not supported by VMware, and comes with no warranties express or implied. Please test and validate its functionality before using in a production environment. It aims to focus on exposing New, Update, Remove and Get operations for all key NSX functions as well as adding additional functionality to extend the capabilities of NSX management beyond the native UI or API. It is unlikely that it will ever expose 100% of the NSX API, but feature requests are welcomed if you find a particular function you require to be lacking. PowerNSX is currently a work in progress and is not yet feature complete.

This module connects to the Autotask web services API. It downloads information about entities and fields and generates Powershell functions with parameter validation to support Intellisense script editing. To download first all entities and then detailed information about all fields and selection lists is quite time consuming. To speed up module load time and get to coding faster the module caches both script functions and the field info cache to disk.

A module to run Bicep using PowerShell. The module is a community project built using the Bicep assemblies to provide you with an enhanced Bicep experience directly from PowerShell without having Bicep CLI installed.

The module also provides the additional features:

- Generate ARM template parameter files directly from a Bicep file
- Quickly open the API reference docs by referencing the Bicep types
- Get the result from a build as a string or hashtable instead of writing to a file
- Test if a Bicep file is valid without building it
- Convert JSON objects to Bicep Language
- Install/Update/Uninstall Bicep CLI
- Specify output folder when building* and decompiling Bicep/ARM templates
- Specify output filename when building Bicep files
- Find modules in private module registries
- Clear local module cache

The ADAL.PS PowerShell module wraps ADAL.NET functionality into PowerShell-friendly cmdlets and is not supported by Microsoft. Microsoft support does not extend beyond the underlying ADAL.NET library. For any inquiries regarding the PowerShell module itself, you may contact the author on GitHub or PowerShell Gallery. Active Directory Authentication Library for .NET (ADAL.NET) is an easy to use authentication library. You can use ADAL.NET to acquire security tokens to access protected Web APIs, for instance Microsoft Graph, or another Web APIs.

Microsoft has stated that "ADAL.NET is in maintenance mode and no new features will be added to ADAL.NET anymore. All our ongoing efforts will be focused on improving the new MSAL.NET." You should consider using the MSAL.PS PowerShell module which uses the new MSAL.NET library.

EPS (Embedded PowerShell), inspired by ERB (see <https://en.wikipedia.org/wiki/ERuby>), is a templating language that embeds PowerShell code into a text document. It is conceptually and syntactically similar to ERB for Ruby or Twig (see <http://twig.sensiolabs.org/>) for PHP. EPS can be used to generate any kind of text. The example below illustrates generating plain text, but it could be used to generate HTML in a web application or PowerShell code as in the Forge Module generator (see <https://github.com/dbroeglin/Forge.Module>)

SimplySql 1.9.0	
<i>Published: 05/28/2022 16:39:27 by Mithrandyr</i>	
Querying SQL (SQL Server, Oracle, PostgreSQL, SQLite, & mySql) the PowerShell way: simple commands... powerful opportunities.	
SimplySql is a module that provides an intuitive set of cmdlets for talking to databases that abstracts the vendor specifics, allowing you to focus on getting work done. The basic pattern is to connect to a database, execute one or more sql statements and then close your database connection. This module provides cmdlets that map to this basic pattern. Each provider has its own Open-*Connection cmdlet -> Open-SqlConnection, Open-SQLiteConnection, Open-OracleConnection, Open-PostGreConnection, Open-MySqlConnection. The rest of the commands are provider agnostic.	
Open/Close/Show/Test/Set/Get -SqlConnection >> Control as many active connections as you want. Invoke-SqlScalar/SqlQuery/SqlUpdate >> Interact with those connections. Get/Clear -SqlMessage >> Get Informational messages, if provider supports it. Invoke-SqlBulkCopy >> Bulk Dataload from one connection to another.	
Start/Complete/Undo/Get -SqlTransaction >> Utilize transactions!
