[AWSPowerShell | 4.1.141](#)

Published: 08/04/2022 21:39:48 by Amazon.com Inc

The AWS Tools for Windows PowerShell lets developers and administrators manage their AWS services from the Windows PowerShell scripting environment. This version of AWS Tools for Windows PowerShell is compatible with Windows PowerShell 2-5.1. An alternative module, AWSPowerShell.NetCore, provides support for Windows PowerShell 3+ and PowerShell Core 6+ on Windows, Linux and macOS. This product provides support for all AWS services in a single module. As an alternative, a modular variant is also available: separate smaller modules (e.g. AWS.Tools.EC2, AWS.Tools.S3...) allow managing each AWS Service.

xPSDesiredStateConfiguration module which is still compatible with WMF 4 and WMF 5 (though that module is not supported and may be removed in the future).

Pester provides a framework for running BDD style Tests to execute and validate PowerShell commands inside of PowerShell and offers a powerful set of Mocking Functions that allow tests to mimic and mock the functionality of any command inside of a piece of PowerShell code being tested. Pester tests can execute any command or script that is accessible to a pester test file. This can include functions, Cmdlets, Modules and scripts. Pester can be run in ad hoc style in a console or it can be integrated into the Build scripts of a Continuous Integration system.

[Write-ObjectToSQL | 1.13](#)

Published: 02/11/2017 21:09:56 by John Roos

Writes an object into a database table. If the table does not exist it will be created based on the properties of the object. For every property of the object a column will be created. The data type for each column will be converted from .Net data types into SQL Server data types.

Not all data types are supported. Unsupported data types will be ignored (but can be listed). If several objects are sent through the pipeline only the first object will be used for creating the template for the table.

Make sure that all objects in the pipeline have the exact same properties (this is usually the case). While creating the table the script will also add two default columns. One called 'id' which is a regular auto counter (integer which increases with 1 for every row) and another column called 'inserted_at' which will have a default value of GetDate() which represents the timestamp for when the row was inserted. If a property is named the same as one of these default columns then a 'x' will be added before the name of those columns to avoid duplication. (if propertyname=id, then propertyname=ixid, etc.)

Hashtables are handled slightly different. When using hashtables the script will simply use the keys as columns. Keep in mind that properties on the objects are used. Some objects, like strings, might only have a length property but what you really want to insert into the table is the value of the string.

The following command would generate a table with one column called Length which would contain the length of the strings (probably not what you want):

'oink','meo'	Write-ObjectToSQL -Server localhost\sqlexpress -Database MyDB -TableName myTable
--------------	---

The following command is a better way to do it. Instead of piping the strings directly you should create custom objects or, as in this example, hash tables. This will generate a table with a column called 'text' which will contain the values 'oink' and 'meo':

@{'text'='oink'}, @{'text'='meo'}	Write-ObjectToSQL -Server localhost\sqlexpress -Database MyDB -TableName myTable
-----------------------------------	---

Another thing to note is that this script will only take Property and NoteProperty into consideration. So for example ScriptProperty and ParameterizedProperty will be ignored. You can verify your objects with the Get-Member cmdlet and check the MemberType.

Currently the script supports the following data types:

Int32 UInt32 Int16 UInt16 Int64 UInt64 long int Decimal Single Double Byte SByte String DateTime TimeSpan
datetime string bool Boolean GUID

[AWS.Tools.Common | 4.1.141](#)

Published: 08/04/2022 21:40:36 by Amazon.com Inc

The AWS Tools for PowerShell lets developers and administrators manage their AWS services from the PowerShell scripting environment. In order to manage each AWS service, install the corresponding module (e.g. AWS.Tools.EC2, AWS.Tools.S3...). The module AWS.Tools.Installer (<https://www.powershellgallery.com/packages/AWS.Tools.Installer/>) makes it easier to install, update and uninstall the AWS.Tools modules. This version of AWS Tools for PowerShell is compatible with Windows PowerShell 5.1+ and PowerShell Core 6+ on Windows, Linux and macOS. When running on Windows PowerShell, .NET Framework 4.7.2 or newer is required. Alternative modules, AWSPowerShell.NetCore and AWSPowerShell, provide support for all AWS services from a single module and also support older versions of Windows PowerShell and .NET Framework.

[PowerNSX](#) | 3.0.1192

PowerNSX is a PowerShell module that abstracts the VMware NSX API to a set of easily used PowerShell functions. This module is not supported by VMware, and comes with no warranties express or implied. Please test and validate its functionality before using in a production environment. It aims to focus on exposing New, Update, Remove and Get operations for all key NSX functions as well as adding additional functionality to extend the capabilities of NSX management beyond the native UI or API. It is unlikely that it will ever expose 100% of the NSX API, but feature requests are welcomed if you find a particular function you require to be lacking. PowerNSX is currently a work in progress and is not yet feature complete.
